

IMAC Holdings, Inc. Announces Completion of Second Cohort of its Phase 1 Clinical Study of Umbilical Cord-Derived Mesenchymal Stem Cells for the Treatment of Bradykinesia Due to Parkinson's Disease

February 16, 2022

BRENTWOOD, Tenn., Feb. 16, 2022 (GLOBE NEWSWIRE) -- IMAC Holdings, Inc. (Nasdaq: IMAC) ("IMAC" or "the Company"), today announces it has completed the second cohort of its Phase 1 clinical trial for its investigational compound utilizing umbilical cord-derived allogenic mesenchymal stem cells for the treatment of bradykinesia due to Parkinson's disease.

The second cohort consists of five patients with bradykinesia due to Parkinson's disease receiving an intravenous infusion of a medium concentration stem cell treatment. The cohort was completed on Tuesday, February 15, 2022. In accordance with the trial protocol, the Company will wait at least 30 days to demonstrate safety of the medium concentration dose before initiating the third and final cohort in which five patients will receive a high concentration intravenous dose of stem cells.

About IMAC's Phase 1 Clinical Trial

The Phase 1 clinical trial, consisting of a 15-patient dose escalation safety and tolerability study, is being conducted at three of IMAC's clinical centers in Chesterfield, Missouri, Paducah, Kentucky, and Brentwood, Tennessee. The trial is divided into three groups: 1) five patients with bradykinesia due to Parkinson's disease will receive a low concentration dose, intravenous infusion of stem cells, 2) five will receive a medium concentration intravenous dose, 3) and five will receive a high concentration intravenous dose. All groups will be subsequently tracked for 12 months. IMAC's medical doctors and physical therapists at the clinical sites have been trained to administer the treatment and manage the therapy. Ricardo Knight, M.D., M.B.A., who is medical director of the Mike Ditka IMAC Regeneration Center, is the trial's principal investigator.

The Institute of Regenerative and Cellular Medicine serves as the trial's independent investigational review board, while Regenerative Outcomes provides management of the study. Further details of the trial can be found at clinicaltrials.gov.

About Bradykinesia Due to Parkinson's Disease

In addition to unusually slow movements and reflexes, bradykinesia may lead to limited ability to lift arms and legs, reduced facial expressions, rigid muscle tone, a shuffling walk, and difficulty with repetitive motion tasks, self-care, and daily activities. Parkinson's disease is the typical culprit of bradykinesia, and as it progresses through its stages, a person's ability to move and respond declines.

According to Zion Market Research, the global Parkinson's disease therapeutics market was \$2.61 billion in 2018 and is expected to grow to \$5.28 billion by 2025. The Parkinson's Disease Foundation estimates that nearly 10 million people are suffering from Parkinson's disease, and almost 60,000 new cases are reported annually in the U.S.

About IMAC Holdings, Inc.

IMAC was created in March 2015 to expand on the footprint of the original IMAC Regeneration Center, which opened in Kentucky in August 2000. IMAC Regeneration Centers combine life-science advancements with traditional medical care for movement restricting diseases and conditions. IMAC owns or manages more than 15 outpatient clinics that provide regenerative, orthopedic and minimally invasive procedures and therapies. It has partnered with several active and former professional athletes including Ozzie Smith, David Price, Mike Ditka and Tony Delk. IMAC's outpatient medical clinics emphasize treating sports and orthopedic injuries and movement-restricting diseases without surgery or opioids.
